

Rocketmq streams

编程题

基于代码实例FileSourceExample以及data数据源,打印出inflow大于4且LogStore为LogStore-1的projectname

```
1 public class FileSourceExample {
2     public static void main(String[] args) {
3         DataStreamSource source = StreamBuilder.dataStream("namespace", "pipeline");
4         source.fromFile("data.txt", true)
5             .map(message -> message)
6             .filter(message -> ((JSONObject)message).getInteger("InFlow") > 4 &&
7                 ((JSONObject)message).getString("LogStore").equals("LogStore-1"))
8             .selectFields("ProjectName")
9             .toPrint(1)
10            .start();
11    }
12 }
```
